ABSTRACT

PROCESS FOR KEEPING AND/OR RESTORING COMMUNICATION LINKS IN A PLANED NETWORK WITH MOBILE COMPONENTS

Process and system for keeping and/or restoring communications within a network with planned resources, the said network comprising at least several stations Si distributed in subgroups, each of the said subgroups comprising at least one or several groups {Gi} each composed of at least two stations Si connected together, the link between these two stations possibly changing with time.

Le process comprises the following steps,

within a sub-group:

- a) associate a dummy station FGi to a group {Gi}, the dummy station comprising different resources RGi, allocated to stations in the group {Gi},
- b) starting from information about how the structure of the group {Gi} changes:
 - c) set up one or several relays Ri adapted to keep and/or restore communications between the different elements of the group {Gi},
 - d) reallocate resources of the dummy station FGi to all relay stations Ri set up.
